Rewrite the function

Rewrite the function

$$\begin{array}{c}
 y_1 \ y_2 \ y_3 \ \dots \ y_m \text{ data point } y \\
 \left. \begin{array}{c} \text{grid}_1 \\ \vdots \\ \text{grid}_n \end{array} \right\} n \times n \left[\begin{array}{c} \text{weight} \end{array} \right] = W
 \end{array}$$

$$\begin{array}{c}
 \delta_1 \ \dots \ \delta_p \ p=14 \\
 \left[\begin{array}{c} y_1 \\ \vdots \\ y_m \end{array} \right] \text{ marker values} = M
 \end{array}$$

result $X = D \times M$

$$\begin{array}{c}
 \delta_1 \ \dots \ \delta_p \ p=14 \\
 \left[\begin{array}{c} 128 \times 128 \\ n \quad n \end{array} \right] \xrightarrow{\text{then reshape to}} \begin{array}{c} n \\ n \end{array} \begin{array}{c} p \end{array}
 \end{array}$$

Rewrite the function

shape $(n^2,)$ $(m,)$ (n^2, m)
↑ ↑ ↑
weight_kernel(grids, points, weights)

idx_grid, idx_val = cuda.grid(2)

if (idx_grid < weights.shape[0] &
 idx_val < weights.shape[1])

grid = grids[idx_grid]

point = points[idx_val]

distance = dist_kernel(grid, point)

weights[idx_grid, idx_val] = dist2weight_kernel(distance)

Quick Results

Next Step

- **Benchmarking the performance of functions**
- **Try to apply the function on EQAPOL data**
